LST Numbers

Definition

Let Q_1, \ldots, Q_n be (Lindström) quantifiers. The *Löwenheim-Skolem-Tarski* number LST (Q_1, \ldots, Q_n) is the least κ such that for all first order \mathcal{L} with $|\mathcal{L}| < \kappa$, every \mathcal{L} structure \mathcal{A} contains an $\mathcal{L} \cup \{Q_1, \ldots, Q_n\}$ elementary substructure $\mathcal{B} \prec \mathcal{A}$ with $|\mathcal{B}| < \kappa$. If no such κ exists we say LST $(Q_1, \ldots, Q_n) = \infty$.

LST Numbers

Definition

Let Q_1, \ldots, Q_n be (Lindström) quantifiers. The *Löwenheim-Skolem-Tarski* number LST (Q_1, \ldots, Q_n) is the least κ such that for all first order \mathcal{L} with $|\mathcal{L}| < \kappa$, every \mathcal{L} structure \mathcal{A} contains an $\mathcal{L} \cup \{Q_1, \ldots, Q_n\}$ elementary substructure $\mathcal{B} \prec \mathcal{A}$ with $|\mathcal{B}| < \kappa$. If no such κ exists we say LST $(Q_1, \ldots, Q_n) = \infty$.

Example

 $\mathsf{LST}() = \aleph_1$

Two standard quantifiers

Definition (The Härtig Quantifier)

 $I(\varphi(x),\psi(y))$ is true in $\mathcal A$ if

$$|\{x: \mathcal{A} \vDash \varphi(x)\}|^{\mathcal{V}} = |\{y: \mathcal{A} \vDash \psi(y)\}|^{\mathcal{V}}$$

э

Two standard quantifiers

Definition (The Härtig Quantifier) $I(\varphi(x), \psi(y))$ is true in \mathcal{A} if

$$|\{x: \mathcal{A} \vDash \varphi(x)\}|^{\mathcal{V}} = |\{y: \mathcal{A} \vDash \psi(y)\}|^{\mathcal{V}}$$

Definition (The Equal Cofinality Quantifier) $Q^{\text{e.c.}}(\varphi(x_1, x_2), \psi(y_1, y_2))$ is true in \mathcal{A} if the two sets

$$\{(x_1, x_2) : \mathcal{A} \vDash \varphi(x_1, x_2)\}$$

and

$$\{(y_1, y_2) : \mathcal{A} \vDash \psi(y_1, y_2)\}$$

are both linear orders and have the same V cofinality.

Two standard quantifiers

Definition (The Härtig Quantifier) $I(\varphi(x), \psi(y))$ is true in \mathcal{A} if

$$|\{x: \mathcal{A} \vDash \varphi(x)\}|^{\mathcal{V}} = |\{y: \mathcal{A} \vDash \psi(y)\}|^{\mathcal{V}}$$

Definition (The Equal Cofinality Quantifier) $Q^{\text{e.c.}}(\varphi(x_1, x_2), \psi(y_1, y_2))$ is true in \mathcal{A} if the two sets

$$\{(x_1,x_2):\mathcal{A}\vDash\varphi(x_1,x_2)\}$$

and

$$\{(y_1, y_2) : \mathcal{A} \vDash \psi(y_1, y_2)\}$$

are both linear orders and have the same V cofinality.

Assume GCH.

Definition

Reg is the class of all regular cardinals.

э

< (T) >

Definition

Reg is the class of all regular cardinals. Reg_0 is the class of successor cardinals.

Definition

Reg is the class of all regular cardinals. Reg_0 is the class of successor cardinals. Reg_1 is the class of simple inaccessibles.

Definition

Reg is the class of all regular cardinals. Reg_0 is the class of successor cardinals. Reg_1 is the class of simple inaccessibles. Reg_2 is the class of inaccessible simple limits of inaccessibles.

Definition

Reg is the class of all regular cardinals. Reg₀ is the class of successor cardinals. Reg₁ is the class of simple inaccessibles. Reg₂ is the class of inaccessible simple limits of inaccessibles. In general, Reg_{α} is the class of successors of Reg \backslash Reg_{$<\alpha$}.

Definition

Reg is the class of all regular cardinals.

 Reg_0 is the class of successor cardinals. Reg_1 is the class of simple inaccessibles. Reg_2 is the class of inaccessible simple limits of inaccessibles. In general, $\operatorname{Reg}_\alpha$ is the class of successors of $\operatorname{Reg} \setminus \operatorname{Reg}_{<\alpha}$.

Definition

 $Q^{\alpha}(\varphi(x_1, x_2), \psi(y_1, y_2), \chi(z_1, z_2))$ is true in \mathcal{A} if the sets X and Y and Z defined over \mathcal{A} by φ , ψ and χ satisfy:

• X and Y are linear orders with the same V cofinality;

Question: What values can LST(I), LST(I, Q^{α}) and LST(I, $Q^{e.c.}$) take?

Theorem (Folklore?)

Let κ be supercompact. Then LST $(I, Q^{e.c.}) \leq \kappa$.

Proof.

Let \mathcal{A} be an \mathcal{L} structure $(|\mathcal{L}| < \kappa)$ with domain $\nu \in \text{On}$. Let $j : V \to M$ with $j(\kappa) > \nu$ and $M^{\nu} \subset M$. Let $\mathcal{B} \in M$ be the pointwise image of \mathcal{A} .

Question: What values can LST(I), LST(I, Q^{α}) and LST(I, $Q^{e.c.}$) take?

イロト 不得 トイヨト イヨト 二日

Question: What values can LST(I), LST(I, Q^{α}) and LST(I, $Q^{e.c.}$) take?

Theorem (Magidor, Väänänen, 2011)

LST(I) is at least the first inaccessible. If supercompacts are consistent, then this is optimal: there exists a universe where LST(I) is precisely the first inaccessible.

Question: What values can LST(I), LST(I, Q^{α}) and LST(I, $Q^{e.c.}$) take?

Theorem (Magidor, Väänänen, 2011)

LST(I) is at least the first inaccessible. If supercompacts are consistent, then this is optimal: there exists a universe where LST(I) is precisely the first inaccessible.

 $LST(I, Q^{e.c.})$ is at least the first Mahlo cardinal. If supercompacts are consistent, then this is optimal.

Question: What values can LST(I), LST(I, Q^{α}) and LST(I, $Q^{e.c.}$) take?

Theorem (Magidor, Väänänen, 2011)

LST(I) is at least the first inaccessible. If supercompacts are consistent, then this is optimal: there exists a universe where LST(I) is precisely the first inaccessible.

 $LST(I, Q^{e.c.})$ is at least the first Mahlo cardinal. If supercompacts are consistent, then this is optimal.

Theorem (H.T.)

Suppose that there are no Mahlo cardinals below α . Then $LST(I, Q^{\alpha}) \geq \min(\text{Reg}_{\alpha})$, and assuming supercompacts this is optimal.

A hypothesis

It seems that the lower bound of a quantifier is the smallest large cardinal which can't be identified by that quantifier.

▶ < ∃ >

< 🗇 🕨

э

A hypothesis

It seems that the lower bound of a quantifier is the smallest large cardinal which can't be identified by that quantifier.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(I) is either an inaccessible or a limit of inaccessibles.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α} .

9/17

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α} .

Proof (Sketch, 1).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ .

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α}.

Proof (Sketch, *I*).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ . Let $\mathcal{A} = (H_{\kappa^+}, \in, \gamma)_{\gamma \leq \mu}$.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α}.

Proof (Sketch, *I*).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ . Let $\mathcal{A} = (\mathcal{H}_{\kappa^+}, \in, \gamma)_{\gamma \leq \mu}$. Find $\pi : \mathcal{B} \to \mathcal{A}$ which is I elementary, with \mathcal{B} transitive of size $< \kappa$.

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α}.

Proof (Sketch, *I*).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ . Let $\mathcal{A} = (H_{\kappa^+}, \in, \gamma)_{\gamma \leq \mu}$. Find $\pi : \mathcal{B} \to \mathcal{A}$ which is I elementary, with \mathcal{B} transitive of size $< \kappa$. $\beta := \text{cp}(\pi) > \mu$ is a limit cardinal of \mathcal{B} , because \mathcal{A} and \mathcal{B} calculate cardinals correctly.

Cardinals which can't be LST numbers

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α}.

Proof (Sketch, *I*).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ . Let $\mathcal{A} = (\mathcal{H}_{\kappa^+}, \in, \gamma)_{\gamma \leq \mu}$. Find $\pi : \mathcal{B} \to \mathcal{A}$ which is I elementary, with \mathcal{B} transitive of size $< \kappa$. $\beta := \text{cp}(\pi) > \mu$ is a limit cardinal of \mathcal{B} , because \mathcal{A} and \mathcal{B} calculate cardinals correctly. Moreover, β is inaccessible in \mathcal{B} .

Cardinals which can't be LST numbers

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

If it exists, LST(1) is either an inaccessible or a limit of inaccessibles. More generally, if α is below the least hyperinaccessible then if it exists, LST(1, Q^{α}) is either an element of Reg_{α} or a limit of Reg_{α}.

Proof (Sketch, *I*).

Say $\kappa = \text{LST}(I)$ isn't a limit of inaccessibles. Let $\mu < \kappa$ be the supremum of the inaccessibles below κ . Let $\mathcal{A} = (\mathcal{H}_{\kappa^+}, \in, \gamma)_{\gamma \leq \mu}$. Find $\pi : \mathcal{B} \to \mathcal{A}$ which is I elementary, with \mathcal{B} transitive of size $< \kappa$. $\beta := \operatorname{cp}(\pi) > \mu$ is a limit cardinal of \mathcal{B} , because \mathcal{A} and \mathcal{B} calculate cardinals correctly. Moreover, β is inaccessible in \mathcal{B} . So $\pi(\beta) > \mu$ is inaccessible in \mathcal{A} , and must be κ .

9/17

Cardinals which can be LST numbers

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

10/17

Cardinals which can be LST numbers

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

Suppose that GCH holds, κ is supercompact and the largest inaccessible, $\alpha \neq 0$ is below the first hyperinaccessible and $0 \neq \beta < \kappa$. There is a generic extension in which LST(I, Q^{α}) is the β 'th element of Reg_{α}.

Cardinals which can be LST numbers

Hypothesis

The possible LST numbers of these quantifiers are precisely those cardinals that the quantifiers can't identify which are \leq the first supercompact.

Theorem (H.T., Osinski)

Suppose that GCH holds, κ is supercompact and the largest inaccessible, $\alpha \neq 0$ is below the first hyperinaccessible and $0 \neq \beta < \kappa$. There is a generic extension in which LST(I, Q^{α}) is the β 'th element of Reg_{α}.

If $\alpha = 1$ then we also get that $LST(I) = LST(I, Q^1)$.

_ST numbers for regularity quantifiers

GBSW7, February 2024

イロト イヨト イヨト イヨト

14 / 17

To do this we need $H \subset j(\mathbb{P})$ and $j^* : V[G] \to M[H]$ extending j.

イロト 不得 トイヨト イヨト 二日

To do this we need $H \subset j(\mathbb{P})$ and $j^* : V[G] \to M[H]$ extending j. j^* exists for a given H iff $j''G \subset H$.

イロト 不得 トイヨト イヨト 二日

To do this we need $H \subset j(\mathbb{P})$ and $j^* : V[G] \to M[H]$ extending j. j^* exists for a given H iff $j''G \subset H$. We want to construct a forcing \mathbb{P} which includes $NM_{\kappa} \star Col_{\kappa}$ such that if

G is \mathbb{P} generic, then for all *j* elementary, j''G is contained in a $j(\mathbb{P})$ generic filter.

글 제 제 글 제

We can't just use $\mathbb{P} = \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. If we did then $j(\mathbb{P}) = \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ and:

イロト イポト イヨト イヨト 二日

We can't just use $\mathbb{P} = \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. If we did then $j(\mathbb{P}) = \mathsf{NM}_{i(\kappa)} \star \mathsf{Col}_{i(\kappa)}$ and:

• If C is the NM_{κ} club, j''C = C needs to be a condition in NM_{$i(\kappa)$}, but $C \notin M$;

We can't just use $\mathbb{P} = \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. If we did then $j(\mathbb{P}) = \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ and:

- If C is the NM_κ club, j"C = C needs to be a condition in NM_{j(κ)}, but C ∉ M;
- Even if C were added to M, κ is regular so $C \notin NM_{i(\kappa)}$;

3 × < 3 ×

We can't just use $\mathbb{P} = \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. If we did then $j(\mathbb{P}) = \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ and:

- If C is the NM_κ club, j"C = C needs to be a condition in NM_{j(κ)}, but C ∉ M;
- Even if C were added to M, κ is regular so $C \notin NM_{i(\kappa)}$;
- Even if κ were singularised, Col_{κ} would be changed by doing this.

We can't just use $\mathbb{P} = \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. If we did then $j(\mathbb{P}) = \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ and:

- If C is the NM_κ club, j"C = C needs to be a condition in NM_{j(κ)}, but C ∉ M;
- Even if C were added to M, κ is regular so $C \notin NM_{i(\kappa)}$;
- Even if κ were singularised, Col_{κ} would be changed by doing this.

Define a new forcing \mathbb{Q}_{κ} which can modify M to solve these issues:

- Adds an NM_κ club;
- Singularises κ ; and
- Does "magic" to make Col_κ work.

 $\mathsf{LST}(I, Q^{\alpha}) \leq \kappa$

Let \mathbb{P}_{κ} be an iteration of \mathbb{Q}_{γ} for $\gamma < \kappa$, and let $\mathbb{P} = \mathbb{P}_{\kappa} \star \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$.

< 47 ▶

▶ < ∃ >

Let \mathbb{P}_{κ} be an iteration of \mathbb{Q}_{γ} for $\gamma < \kappa$, and let $\mathbb{P} = \mathbb{P}_{\kappa} \star \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. \mathbb{P} does not contain \mathbb{Q}_{κ} so κ is regular in V[G].

3 × 4 3 ×

Let \mathbb{P}_{κ} be an iteration of \mathbb{Q}_{γ} for $\gamma < \kappa$, and let $\mathbb{P} = \mathbb{P}_{\kappa} \star \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. \mathbb{P} does not contain \mathbb{Q}_{κ} so κ is regular in V[G]. $j(\mathbb{P}) = \mathbb{P}_{j(\kappa)} \star \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ contains \mathbb{Q}_{κ} , so for any j we can define $H \subset j(\mathbb{P})$ generic such that $j''G \subset H$.

Let \mathbb{P}_{κ} be an iteration of \mathbb{Q}_{γ} for $\gamma < \kappa$, and let $\mathbb{P} = \mathbb{P}_{\kappa} \star \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. \mathbb{P} does not contain \mathbb{Q}_{κ} so κ is regular in V[G]. $j(\mathbb{P}) = \mathbb{P}_{j(\kappa)} \star \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ contains \mathbb{Q}_{κ} , so for any j we can define $H \subset j(\mathbb{P})$ generic such that $j''G \subset H$. $j(\mathbb{P})$ does not contain any nontrivial \mathbb{Q}_{γ} for $\kappa < \gamma < \nu$.

16 / 17

Let \mathbb{P}_{κ} be an iteration of \mathbb{Q}_{γ} for $\gamma < \kappa$, and let $\mathbb{P} = \mathbb{P}_{\kappa} \star \mathsf{NM}_{\kappa} \star \mathsf{Col}_{\kappa}$. \mathbb{P} does not contain \mathbb{Q}_{κ} so κ is regular in V[G]. $j(\mathbb{P}) = \mathbb{P}_{j(\kappa)} \star \mathsf{NM}_{j(\kappa)} \star \mathsf{Col}_{j(\kappa)}$ contains \mathbb{Q}_{κ} , so for any j we can define $H \subset j(\mathbb{P})$ generic such that $j''G \subset H$. $j(\mathbb{P})$ does not contain any nontrivial \mathbb{Q}_{γ} for $\kappa < \gamma < \nu$. So $\mathsf{LST}(I, \mathbb{Q}^{\alpha}) \leq \kappa$.
